Even though it's not technically moving closer to Earth, scientists can measure the distance in three ways. The first is simply looking at the lunar distance, measured in thousandths of a million miles. It's getting smaller! Using the second method, taking a lunar distance rate, scientists calculate the distance between the Earth and the Moon in millions of miles, compared to millions of years ago. By knowing the time, they can see how fast the Moon is moving toward Earth. The distance is decreasing about 27 miles per second, which is an average of two inches per year. Since the third method is observing the Earth-Moon distance over time, it can be used to calculate the Moon's orbital velocity. It's going to be interesting to see what happens with this info when we have a lunar eclipse on February 10th and 11th.John Garvey (Ontario politician) John Garvey (born 82157476af
